

Andrei Levchenko

duxan.lev@gmail.com

+381628932714

Novi Sad, Serbia

Summary

Software engineer with experience in backend systems, multiplayer networking, and blockchain infrastructure. Focused on building high-performance, scalable services and cross-platform applications with strong emphasis on reliability, maintainability, and system architecture.

Skills

Docker, MAUI, C#, Blazor, HAproxy, Nginx, Rust, SQL, Git, Gitlab CI/CD, FFmpeg, Linux, AI, Blockchain, Smart Contracts, Unreal Engine, TypeScript, LLM Integration, AI-assisted Development

Experience

Owner

K**ra VPN (in-house project) • Novi Sad, Serbia

04/2026 - Present

Responsibilities:

- Development and maintenance of the server infrastructure for a VPN service for Windows, macOS, Linux, Android, and iOS.
- Design of network architecture and traffic routing.
- Configuration and testing of VPN/proxy protocols and transports, including VLESS, Reality, gRPC, XHTTP.
- Development of solutions to improve the service's resistance to blocking.
- Configuring Nginx/Haproxy, API Gateway, reverse proxy, SNI-routing, and distributing domains among backend servers.
- Testing performance, loading/serving speed, latency, and stability of various connection schemes.
- Administering Linux servers, network ports, DNS, TLS, and related infrastructure.
- Selecting server configurations and assessing infrastructure throughput/cost.

Key achievements:

- Developed and launched the cross-platform VPN service K***ra VPN, supporting five major desktop and mobile platforms.
- Developed a multi-level anti-blocking infrastructure with several alternative transport means and the ability to switch between proxy/VPN schemes depending on network restrictions.

Software Engineer (Office)

BlockZero DOO • Novi Sad, Serbia

06/2024 - 04/2026

Responsibilities

- Development, maintenance, debugging, and testing of a cross-platform wallet application. Development, support, and debugging of a cross-platform wallet application for the GlobalForce network.
- Development and maintenance of backend services for GlobalForce.
- Developed a real-time Voice-to-Voice AI translation system, integrating locally hosted ASR, translation, and TTS models.
- Designed and developed the LARVA Link IoT hardware prototype using LoRa/Meshtastic mesh networking, I²C sensors, and encrypted telemetry transmission.
- Developed gateway software for LARVA Link devices and integrated collected telemetry with backend/blockchain infrastructure.

- Diagnosing problems across the entire chain: wallet/client → API → backend → blockchain/network.
- Integration testing и backend validation.
- Searching for, reproducing, and localizing defects between frontend, wallet, API, and backend.
- Analysis of logs, server configurations, and network interactions.
- Performance optimization, reliability, and scalability of backend services.
- Configuration and maintenance of server infrastructure, Docker/Linux, deployment and CI/CD.
- Deployment, configuration, administration, and migration of GitLab CE on a dedicated server, including repository and configuration transfer to new infrastructure.
- Working with WebSocket and distributed infrastructure.
- Coordination of changes between the backend, the client application, server configuration, and deployment.
- Preparation of technical and integration documentation.
- Using AI/LLM to accelerate debugging, prototyping, test development, and documentation.

Key achievements:

- Developed a real-time Voice-to-Voice AI translator, combining speech recognition, machine translation, and voice synthesis into a single pipeline. Implemented local deployment of AI models without relying on third-party cloud APIs, which reduced latency and improved privacy. Optimized the processing and interaction of components for real-time speech translation with minimal delay.
- I was involved in optimizing backend services and horizontal scaling. After changing the architecture of service interactions and changing/optimizing the server infrastructure, we managed to reduce server equipment costs by approximately 60%, while simultaneously increasing the server-side performance by approximately 300% ($\approx 3\times$). This reduced server costs from \$12,000 to \$4,000–\$5,000 per month.
- Additionally, my experience at this company was significantly broader than that of a typical Software Engineer position: I was involved in GlobalForce's infrastructure, nodeos, API/proxy, performance, SHIP/state history, Rust services, and backend/infra architecture tasks, as well as cross-platform wallet development.

Game Developer (Remote)

SWISS TECH CAPITAL AG • Zug, Switzerland

09/2022 - 06/2024

Responsibilities:

- Development and maintenance of multiplayer gameplay systems
- Working with client-server networking, replication, and state synchronization.
- Searching for and fixing errors in gameplay logic, network interaction, and stability.
- Functional, regression, and exploratory testing of game mechanics and multiplayer interactions.
- Implemented improvements that allow the system to better utilize increased hardware resources, enabling higher performance through vertical scaling of CPU, memory, and processing capabilities.
- Optimization of CPU/GPU/RAM usage, game resources, and rendering for the AMD R5 3600, GTX 1063, 16GB DDR4 system.
- Improving the visual aspects of the game and its performance.
- Analysis of problems that arise only in a network environment.
- Working in a distributed team and maintaining the existing codebase.

Key achievements:

- I improved the network component of the multiplayer systems, achieving stable hit registration and a comfortable shooting experience even with a ping of 100–200 ms.
- I optimized the client-server synchronization and network state processing, reducing the impact of high latency on the gameplay.

Game Developer (Remote)

COFFE • Kostroma, Russia

07/2020 - 09/2022

- Designed and implemented core game mechanics, including player interaction systems, combat logic, and gameplay rules that define the overall player experience.
- Developed matchmaking functionality for session-based multiplayer games, including player queue management, session creation, player grouping, and balancing of matches to ensure fair and stable gameplay sessions.
- Developed a reliable hit detection system for combat interactions, handling collision detection, damage calculation, and validation to maintain accurate and fair gameplay.

- Worked on various supporting systems including gameplay logic improvements, debugging tools, performance optimization, and general codebase maintenance to improve stability and scalability.

Education

Mechanical Technician

Trade and Economic College • Kostroma, Russia

07/2021

- Award recipient at the **Archimedes International Exhibition of Inventions (Moscow, 2020–2021)** for robotics projects presented among participants from Europe and Asia.
- **Additional Education**
Self-directed study in software engineering, including backend development, distributed systems, networking, and game development.
